Dim to Warm LED Fixtures
The next piece of the LED Lighting puzzle

Todays' LEDs can be used in virtually any lighting application with greatly improved colour quality and warm CCTs at high CRI levels. When fixtures are being used on a dimmer, as the light level drops, todays' LEDs maintain the same colour temperature that they exhibit at full power. Incandescent and halogen lamps dim to a warmer CCT at lower levels.

Dim-to-warm technology is now available in LED lighting fixtures they can deliver 3000°K CCT light at full power yet smoothly reduce the CCT to the 2000°K range at the lowest dimming light levels. This technology was designed to mimic the incandescent and halogen lamps that dim to a warmer colour temperature using the same low-cost triac dimmers.

Features
- LED technology fits anywhere you need general light source
- No Recessed fixture required
- Slim 1½" thickness design
- I.C. rated for direct contact with insulation
- Perfect solution where joists or duct work would normally prevent recessed installation
- Ideal for drop ceilings
- Easy to install yourself
- Lifetime Warranty
- Damp location rated for soffit applications
- Dim to warm, 3000°K ~ 2000°K
- Integrated LED fixtures
- Available in white
